

LSP TASK-1

LINUX KERNEL ARCHITECTURE

Scheduler - It manages CPU scheduling and helps in process prioritization.
It decides which process runs at any given time on the CPU.

Memory management - manages physical and virtual memory.

File system - It provides file and directory management.
→ Responsible for organizing data into files and directory.

Network stack - implements network protocols and communication.

system call interface - interface for user application to access kernel services.

Hardware Abstraction layer (HAL) - It provides abstraction over hardware devices.

Hardware - It is the physical component of the system.
