

SDLC
Assignment-1

Name - Puspanjali Tarai
Regd no - 2141020006

(I) Requirements -

- This is the foundation of the project
- It helps in understanding what the client or end-user needs
- It reduces the risk of scope creep and work.
- Interconnection - The SRS guides the design phase by providing functional and non-functional requirements.

(II) Design -

- ~~The~~ converts requirements into a blueprint for development.
- ensures the system architecture is robust, scalable and secure.
- Interconnection - The design guides the implementation phase by describing how the software be built.

(III) Implementation

- The actual development takes place based on the design documents.
- Each module is coded according to the predefined standards and logic.
- Interconnection - The output is tested in the next Testing phase for quality assurance.

(IV) Testing

- It ensures the software is bug-free, secure and meets the requirements.
- It detects issues early to avoid costlier fixes after deployment.
- Interconnection - only after passing testing, the product moves to deployment.

(V) Deployment -

- It delivers the software to the production environment where users can access it.
- It marks the transition from development to actual usage.
- Interconnection - After deployment, feedback may lead to requirement changes, starting the SDLC cycle again.
